KingAgroot and Huilong RMF launch Clawin herbicide in China

25 November 2026 | News

The new formulation combines glyphosate with patented fluchloraminopyr-tefuryl to address difficult-to-control weeds and expand weed management options.

KingAgroot CropScience and Huilong RMF Group jointly launched Clawin, a non-selective herbicide, on 11 November 2026 in Hefei, China. The formulation combines glyphosate with fluchloraminopyr-tefuryl (FCA), a patented synthetic auxin herbicide independently developed by KingAgroot, which received Chinese regulatory registration in February 2026.

The formulation is designed to target above-ground vegetation and underground root systems, helping suppress weed regrowth. According to KingAgroot's technical assessments, Clawin provides weed control lasting up to 1.5 to 2 times longer than conventional treatments and maintains activity at average daily temperatures of 12–15°C. Intended applications include orchards, forestry plantations, roadsides, railways and other non-crop areas, subject to approved label directions.

The product launch follows the renewal of a strategic cooperation agreement between KingAgroot and Huilong RMF Group in September 2026. The partnership combines KingAgroot's proprietary agrochemical research and development capabilities with Huilong RMF Group's distribution network to expand the commercial availability of crop protection products across China.
