Syngenta announced that its Aracati facility in Brazil has become the primary technological hub for research and development of new corn hybrids in all of Latin America.

This innovation powerhouse in the interior of Ceará is responsible for supplying corn hybrids to the North American market, and it will make new technologies available in the region in a shorter timeframe.

Alongside a laboratory and two netted areas, the facility includes 14 new greenhouses that simulate the same temperature, humidity, and light conditions as the region where the new seeds are being developed.
