The facility will improve the function of the National Sheep and Goat Breeding Center by increasing the capacity of barn infrastructure from 400 to 650 sheep.

The facility will improve the function of the National Sheep and Goat Breeding Center by increasing the capacity of barn infrastructure from 400 to 650 sheep.

Taiwan's Ministry of Agriculture, Food Security and Enterprise (MAFSE), in collaboration with the Taiwan ICDF Breeding Sheep and Goat Production and Guidance System Enhancement Project (Sheep Project Phase II), inaugurated at the National Sheep and Goat Breeding Center in Central Farm.

The facility will improve the function of the National Sheep and Goat Breeding Center by increasing the capacity of barn infrastructure from 400 to 650 sheep. In addition, the related components of the new sheep barn, such as the gutter system (also known as a water harvesting system), will enhance the management and sustainability of water utilization. It is one of the main achievements so far of the Sheep Project Phase II.

In his remarks, Jose Mai, Minister of Agriculture, Food Security and Enterprise, spoke about the growth of the sheep and goat livestock sub-sector and the success of the Taiwan Breeding Sheep and goat program thus far with increases in the quality of lamb and goat meats available for consumption due to better breeds and higher local production. He said there is much more to achieve as Belize keeps an eye on export market opportunities.

The ceremony not only marked a historic milestone of the Breeding Sheep and Goat Project in Belize but also gives evidence of the strong ties between Taiwan and Belize. The governments of Belize and the Republic of China (Taiwan) are committed to working closely together to strengthen Belize's sheep and goat industry by further bilateral cooperation in agriculture, which will enhance the welfare of the Belizean people.
