

FAO publishes first global report on black soils

07 December 2022 | News

The report highlights two main goals: the preservation of natural vegetation on black soil and the adoption of sustainable soil management approaches on cropped black soils.

The report highlights two main goals: the preservation of natural vegetation on black soil and the adoption of sustainable soil management approaches on cropped black soils.

The Food and Agriculture Organization of the United Nations (FAO) launched the first global report on black soils on World Soil Day 2022, which are at greater risk than ever due to the climate crisis, biodiversity loss and land use change.

The focus of this year's World Soil Day event, held in the hybrid form at FAO's headquarters in Rome, is the role of soils in food security and how the loss of soil fertility results in low crop yields and crop failures, leading to local populations to hunger, malnutrition and poverty.

A whopping 95 per cent of the food we eat comes directly or indirectly from our soils, which have the extraordinary capacity to store, transform, and recycle nutrients that we all need to survive, allowing life to continue. Of the 18 nutrients essential to plants, 15 are supplied by soils - if they are healthy. However, about one third of soils worldwide are already degraded, and the loss of soil fertility means that land is less productive and cereals and vegetables and fruits are not as rich in vitamins and nutrients as they were 70 years ago.

Participants including Janusz Wojciechowski, EU Commissioner for Agriculture, Lee Seong-ho, Permanent Representative of the Republic of Korea to FAO, and Victor Vasiliev, Permanent Representative of the Russian Federation, were introduced to The Global Status of Black Soils report and the Soil Atlas of Asia. The event also saw the delivery of the Glinka World Soil

Prize 2022 to Ashok Patra Kumar, a renowned soil scientist from the ICAR-Indian Institute of Soil Science (IISS) in Bhopal, and the King Bhumibol World Soil Day Award 2022 to the Universidad Nacional Autónoma de México. The IUS Distinguished Service Medal 2022 was presented to the Global Soil Partnership to recognize its contribution to soil science since its creation 10 years ago.

In the current food and fertilizer crisis, smallholder farmers, particularly from vulnerable countries across Africa, Latin America and Asia, lack access to organic and inorganic fertilizers and are currently facing a 300 per cent increase in fertilizer prices. These crises call our attention to the crucial role of sustainable management and the restoration of our precious resource to safeguard healthy soils and their fertility.

"Today, reduced availability and soaring fertilizer prices are driving increased food prices and food insecurity," QU Dongyu FAO Director-General said in his opening remarks. "We need to work together to produce safe, nutritious and micronutrient-rich food in a sustainable way that avoids soil degradation, reduces greenhouse gas emissions and decreases agrifood systems pollution."

Black treasure

Black soils are characterized by a thick, dark-coloured soil horizon rich in organic matter. They are found in Russia (327 million hectares), Kazakhstan (108 M ha), China (50 M ha), Argentina (40 M ha), Mongolia (39 M ha), Ukraine (34 M ha), United States of America (31 M ha), Colombia (25 M ha), Canada (13 M ha), and Mexico (12 M ha).

With their inherent fertility, they are the food basket for many countries and are considered essential to the global food supply.

Black soils have another key quality: they are paramount for climate change mitigation and adaptation, as they contain 8.2 per cent of the world's soil organic carbon (SOC) stocks and can provide 10 per cent of the global SOC sequestration potential. SOC sequestration provides multiple benefits for humans and the environment and is one of the most cost-effective options for climate change adaptation and mitigation, as well as for fighting desertification, land degradation and food insecurity.

As The Global Status of Black Soils report shows, this black treasure is under threat. Because of land use change (approximately 31 per cent of global black soils are cultivated), unsustainable management practices and excessive use of agrochemicals, most of the black soils have already lost at least half of their SOC stocks and suffer from moderate to severe erosion processes, as well as nutrient imbalances, acidification, and biodiversity loss.

The report highlights two main goals: the preservation of natural vegetation on black soils such as grasslands, forests and wetlands, and the adoption of sustainable soil management approaches on cropped black soils. It also puts forward tailored recommendations for farmers, national governments, research and academia and the International Network of Black Soils.

Asia Atlas

World Soil Day also saw the pre-launch of the Soil Atlas of Asia, a collaborative effort between FAO's Global Soil Partnership with the European Commission through its Joint Research Centre, and with financial support from the Korean Rural Development Administration and participating countries. The atlas is designed to raise awareness about soil health among a wide range of stakeholders. Thanks to contributions from over 100 soil experts from 45 countries, the atlas portrays the rich diversity of soils in the region.
