

CropX acquires Acclym (formerly Agritask) and powers enterprise-scale sustainable agriculture

03 September 2025 | News

Acclym brings enterprise customers such as AB InBev, Nestle, General Mills, and McCain Foods to CropX's agronomic farm management platform

Acclym brings enterprise customers such as AB InBev, Nestle, General Mills, and McCain Foods to CropX's agronomic farm management platform

CropX Technologies, a global leader in digital agronomic solutions, has acquired **Acclym** (formerly Agritask), an enterprise-grade agricultural intelligence company known for enabling top food and beverage brands to deliver on their agricultural sustainability commitments.

CropX will integrate Acclym's capabilities into its agronomic farm management system, expanding its offerings to enterprise-level customers and unlocking high-impact new use cases in **sustainability, regenerative agriculture, and climate-smart supply chains**.

Acclym's technology powers agricultural decision-making at scale for **Enterprise food and beverage leaders**, relying on Acclym to monitor, verify, and improve the performance and sustainability of their global agricultural supply chains. This marks the **seventh strategic acquisition** by CropX, following its 2024 acquisition of nitrogen sensor innovator EnGeniousAg and 2023 acquisition of **Australia's Green Brain**.

Acclym raised **\$42 million** in venture funding from investors including Liechtenstein Group, Bridges Israel, and Smart Agro Fund, and has been deployed across millions of hectares worldwide. Its solutions bridge the gap between on-farm data and boardroom strategy, transforming complex agricultural data into actionable insights for procurement, sustainability, and ESG leaders.

Global food and beverage companies face increasing pressure to meet sustainability and regenerative agriculture goals. Managing these commitments across complex, fragmented supply chains is difficult without reliable, field-level data, making scalable, verifiable ag-tech solutions essential for success.
