The calculator will help agronomists and farmers make data-based decisions on whether to consider replanting their corn

Syngenta Seeds is offering farmers its NK Corn Replant Calculator for free, which will help agronomists and farmers make data-based decisions on whether to consider replanting their corn.

Recommendations from the NK Corn Replant Calculator are generated from publicly available data, and calculations are based on a farmer's location, original planting date, replant date, current plant density and desired plant density. While the calculator provides replanting recommendations based on university data, there's no definitive resource for replant decisions.
