**Strategic collaboration with Carbon Newture strengthens digital carbon governance, supply-chain transparency, and sustainability competitiveness across the agrochemical value chain**

Fuhua Chemical has launched a comprehensive digital carbon management platform developed in partnership with climate technology specialist Carbon Newture, marking a significant step in the company's transition toward data-driven, intelligent low-carbon operations. The platform was unveiled during the opening of the Shanghai International Carbon Neutrality Expo, underscoring the growing importance of digital sustainability infrastructure in the global chemical and crop protection industries.

The launch reflects a broader shift underway across the agrochemical sector as manufacturers face increasing pressure from regulators, customers, and global supply chains to demonstrate measurable progress on emissions management, sustainability performance, and carbon transparency.

As one of China's leading chemical manufacturers with operations spanning mineral resource development, basic chemicals, fine chemicals, and crop protection solutions, Fuhua Chemical has been steadily expanding its sustainability agenda. The company has invested in carbon footprint assessments, clean energy optimisation, circular economy initiatives, industry sustainability standards, and collaborative emission-reduction programmes aimed at strengthening environmental performance across its operations.

The newly launched Fuhua Carbon Management Platform is designed to consolidate these efforts within a unified digital framework. Built on Carbon Newture's proprietary AI-native carbon management architecture, the platform enables real-time carbon accounting, emissions monitoring, supply-chain data integration, compliance reporting, and decision-support analytics.

The system supports carbon management across multiple operational levels, including manufacturing facilities, corporate entities, and supply-chain networks. Advanced functionalities such as intelligent data processing, automated carbon accounting, emissions modelling, and optimisation recommendations are expected to improve both operational efficiency and environmental governance.

The initiative arrives at a time when carbon transparency is increasingly becoming a prerequisite for participation in global chemical supply chains. Sustainability frameworks such as Together for Sustainability (TfS), alongside procurement requirements from multinational companies, are raising expectations around verified carbon data and structured emissions management systems.

For upstream chemical manufacturers, the challenge is particularly complex. Product carbon footprints often extend across multiple stages of production, from raw material extraction and processing to logistics and downstream applications. Managing these interconnected data streams requires sophisticated digital infrastructure capable of delivering accurate, auditable, and scalable carbon intelligence.

Alongside the platform launch, Fuhua Chemical also received product carbon footprint verification for several of its key products, further strengthening the company's sustainability credentials and reinforcing its commitment to internationally recognised environmental standards.

The platform is expected to serve as a strategic foundation for Fuhua's next phase of green growth, enabling the company to move beyond traditional carbon accounting toward integrated low-carbon business management. By linking emissions performance with operational decision-making, customer engagement, and supply-chain collaboration, the company aims to enhance both environmental outcomes and long-term competitiveness.

Industry observers view the development as part of a wider digital transformation reshaping sustainability management across the chemical sector. As carbon data increasingly becomes a strategic business asset, companies that can effectively integrate digital technologies with environmental performance management are likely to gain a competitive advantage in global markets.

With the launch of the Fuhua Carbon Management Platform, Fuhua Chemical is positioning itself at the intersection of digital innovation and sustainable manufacturing, laying the groundwork for more transparent, efficient, and resilient operations while supporting broader decarbonisation efforts across the agrochemical value chain.
