China's Sino-Agri Leading secures Australian approval for saflufenacil herbicide ingredient

09 November 2026 | News

APVMA approval strengthens the company's Australian crop protection portfolio and supports its expansion in international agrochemical markets.

Sino-Agri Leading Biosciences Co., Ltd. ("Sino-Agri Leading") recently announced that its saflufenacil technical material has officially received registration approval from the Australian Pesticides and Veterinary Medicines Authority (APVMA). Following products such as pyroxasulfone and chlorantraniliprole, this registration further enriches the company's portfolio of proprietary registrations in Australia and marks an important step in Sino-Agri Leading's continued efforts to improve its global market access system and deepen the building of its supply chain value platform.

Consolidating Advantages in Bulk Herbicides, Driving Continuous Portfolio Iteration

Sino-Agri Leading has long been deeply engaged in bulk herbicides including glyphosate, glufosinate, paraquat, and diquat. Leveraging its mature global supply network and resource integration capabilities, the company continues to consolidate its core product advantages while actively expanding its differentiated product portfolio.

As a PPO-inhibiting herbicide, saflufenacil holds important application value in broadleaf weed control and diversified weed management systems. The approval of this registration further improves the company's herbicide product matrix and provides new options for product development and cooperation in the Australian market.

Connecting Global Supply and Demand Resources, Creating Long-Term Value Together

The core challenge facing the global agrochemical industry lies not only in product supply, but also in how to bridge market access, regional demand, and supply chain differences to achieve efficient matching between production capacity and end-user agricultural demand.

As a global agrochemical supply chain value platform, Sino-Agri Leading is committed to connecting high-quality upstream manufacturing resources with downstream agricultural market demand. In recent years, the company has continued to increase investment in proprietary registrations in key agrochemical markets. Through building market access capabilities, global resource allocation, and supply chain efficiency improvements, it has enhanced the flexibility, adaptability, and resilience of its supply chain, creating long-term value beyond product transactions for upstream and downstream partners across the value chain.

Riding on this momentum, Sino-Agri Leading will continue to deepen global industrial chain collaboration and work with partners worldwide to create a more open, inclusive, and sustainable agricultural future.
