Fertiberia acquires Codisa-Dicaher to expand fertigation business in Spain

19 November 2026 | News

The acquisition adds a liquid fertiliser production facility and specialised technical capabilities, strengthening Fertiberia's crop nutrition offerings for high-value agriculture.

Grupo Fertiberia has acquired Valencia-based Codisa-Dicaher, a specialist in fertigation solutions, as part of its strategy to expand its portfolio of customised plant nutrition products for high-value crops. The transaction strengthens the Spanish fertiliser group's presence in eastern Spain and adds a liquid fertiliser manufacturing facility and an experienced technical team to its operations.

Codisa-Dicaher brings more than 35 years of experience in developing and supplying fertiliser solutions for agricultural producers in Spain's Levante region, an important centre for intensive and high-value crop production.

The acquisition will enable Fertiberia to expand its fertigation offerings, combining nutrient delivery through irrigation systems with crop-specific technical support.

Expanding specialised crop nutrition capabilities

Fertiberia said the acquisition forms part of its strategy to move towards higher-value plant nutrition solutions tailored to different crops and growing regions.

The group operates a network of production and logistics facilities across Spain, Portugal, France and the Netherlands. Integrating Codisa-Dicaher will strengthen its regional distribution capabilities and provide additional expertise in liquid fertiliser production and fertigation management.

Juan Pablo Llobet, Chief Executive Officer of Grupo Fertiberia, said the company sees opportunities in agricultural regions producing higher-value crops, where specialised formulations and technical services can support growers' specific nutritional requirements.

The company intends to combine Codisa-Dicaher's fertigation expertise with its broader crop nutrition portfolio and biological solutions developed through its Trixia platform. According to Fertiberia, the integration will also support closer coordination between its commercial teams, agronomic specialists and product development activities.

Biotechnology forms part of growth strategy

Alongside the expansion of its fertiliser business, Fertiberia is strengthening its agricultural biotechnology activities through Trixia, a platform focused on biological solutions for crop productivity and plant health. Trixia builds on the research and commercial experience of Trichodex, a company specialising in biological approaches to soil health, plant health and crop performance.

Fertiberia aims to integrate these capabilities with conventional plant nutrition products to offer growers more comprehensive crop management solutions. The group has also strengthened its agronomic services, drawing on analytical, research and development capabilities to provide technical support and crop-specific recommendations.

The acquisition reflects Fertiberia's efforts to expand beyond conventional fertiliser supply towards specialised nutrition and biological solutions for high-value agriculture. Financial terms of the Codisa-Dicaher transaction were not disclosed, and the company has not announced additional production capacity or investment commitments associated with the acquisition.
