The addition of Cainthus to the Ever.Ag portfolio will provide dairy farmers and their advisors new insights from passive data collection

The addition of Cainthus to the Ever.Ag portfolio will provide dairy farmers and their advisors new insights from passive data collection

Ever.Ag, a leading agtech provider dedicated to empowering supply chains to feed a growing world, has acquired Cainthus, a company that offers artificial intelligence-enabled cameras for analyzing dairy operations. The addition of Cainthus to the Ever.Ag portfolio will provide dairy farmers and their advisors new insights from passive data collection.

Ever.Ag CEO Scott Sexton commented, "We believe precision agriculture, now in the dairy barn, is the future. We are committed to growing, expanding, and embedding Cainthus technology into our software suite that spans the supply chain."

The acquisition of Cainthus delivers on Ever.Ag's mission and continues its decades-long tradition of partnering with the dairy industry from farm to fork. Additionally, as consumers become more focused on purchasing environmentally friendly and sustainably produced goods, the data it collects can validate responsible farming practices throughout the supply chain.

Ever.Ag plans to enhance the offerings of its My Dairy Dashboard product and producer portals which integrates data from milk pickups, feed delivered, recorded cow events, milk schedules, and pay information. Cainthus will use the operational data to associate and visually validate herd performance in the barn.

Both Ever.Ag and Cainthus are leaders in data digitisation for dairy farm operations and their animals. Ever.Ag solutions are designed, developed, and produced by a global team with a passion for agtech, client sustainability, and mutual prosperity.
