The second edition of the OpenAg Symposium, hosted by UPL Limited, a global provider of sustainable agricultural solutions, and the Oxford India Centre for Sustainable Development (OICSD), Somerville College, University of Oxford, has outlined a series of policy positions, technological interventions, and financial models to transform food systems as positive contributors to global decarbonisation efforts.

The event united a select group of representatives from academia, policy, finance and the private sector under the theme "Food Futures in a Changing Climate: Reimagining the role of agriculture as a pathway to Net Zero". Following a keynote by Agnes Kalibata, President of the Alliance for a Green Revolution in Africa, panellists from Brazil, India, the United States, Italy, the Netherlands, and Kenya, proposed a series of policies and interventions to ensure future food systems are efficient, resilient, inclusive and sustainable.

Jai Shroff, Global CEO of UPL, commented, "At UPL, we believe that agriculture has a decisive role to play on the path to decarbonisation during this crucial window for action in the fight against climate change. The discussions we've heard at this year's OpenAg Symposium demonstrate the growing appetite for the innovation and cross-sector collaboration required to transform the climate-positive contribution of food systems around the world."
