Finds pooling resources for technological innovation, cultivate talent, and coordinate production, education, and research essential

China is retrospectively evaluating its efforts to boost self-reliance and accelerate breakthroughs in agricultural technology to ensure National food security.

In an inspection tour of east China's Jiangsu Province, Chinese Vice Premier Liu Guozhong said that Agricultural technologies need to meet the diversified demand for development across all agricultural sectors.

Liu stressed that technological innovation plays a critical role in agricultural modernization, and the country must take steps to remove bottlenecks in agricultural technology development.

According to Liu, the country should pool resources for technological innovation, cultivate talent, and coordinate production, education, and research.

The development of agricultural technology must be industry-oriented and help ensure the adequate supply of grain and major farm products, said the vice premier.

During his tour, Liu was briefed on the growth of winter wheat and called for solid efforts to secure a bumper summer harvest.
